SHAPIRO, LEONID

ART UNIT PAPER NUMBER

2629

DATE MAILED: 07/17/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

# Office Action Summary

Application No.

09/777,693

Applicant(s)

KOYAMA ET AL.

Examiner

Leonid Shapiro

Art Unit

2629

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☒ Responsive to communication(s) filed on 11 May 2005.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 1-10, 19-27, 36-45, 54-61 and 71-123 is/are pending in the application.
- 4a) Of the above claim(s) 1-10, 36-45, 54-61, 71-79 and 88-104 is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 19-27, 80-87, 105-123 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

## Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

## Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date 5-11-06
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: \_\_\_\_\_

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1. Claims 19, 25, 80, 105-106, 112, 115-116 are rejected under 35 U.S.C. 103(a) as being unpatentable over Shinya (US Patent No. 5,170,158) in view of Lewis (US Patent No. 5,589,847).

As to claim 19, Shinya teaches an image display device (See Col. 1, Lines 6-10), comprising:

a pixel array portion including a plurality of signal lines (See Fig. 1, item 2), a plurality of scan lines (See Fig. 1, item 3), a plurality of pixel electrodes provided at respective regions where the respective signal lines and the respective scan lines intersect with each other (See Fig. 1, item 4), and plurality of switching elements for driving the plurality of pixel electrodes (See Fig. 1, item 5, Col. 1, Lines 21-30);

a signal line driver circuit for driving the plurality of signal lines (See Fig. 1, item 6, Col. 1, Lines 31-32); and

a scan line driver circuit for driving the plurality of scan lines (See Fig. 1, item 7, Col. 1, Lines 32-39),

wherein signal line driver includes an integral multiple of 8 shift registers (in reference inside of each item 13 are 8 shift registers (DFFs in Figure 1 of the application) connected in series, with 8 outputs to DAC) to which m-bit (m is natural

number) (in reference 8) digital picture signals are inputted (See first example and Fig. 2, item 13, Col. 4, Lines 1-12),

a plurality of D/A converter circuits for converting output signals of the storage circuits into analog signals (Fig. 2, item 15, Col. 4, Lines 1-7), and a plurality of signal line selecting circuits for transmitting output signals of the D/A converter circuits to the corresponding signal lines (See Fig. 2, items P1-Pn, Col. 4, Lines 16-23).

the first example of Shinya does not disclose a plurality of storage circuits for storing output signals of the shift registers by a latch signal.

The third example of Shinya teaches a plurality of storage circuits for storing output signals of the shift registers by a latch signal (See Fig. 10, item 21, Col. 7, Lines 3-18).

It would have been obvious to one of ordinary skill in the art at the time of invention to implement different elements of the source driver as shown by different examples of Shinya because of small driver circuit size requirements (See Col. 1, Lines 16-18 in the Shinya reference).

Shinya does not disclose an operation in which the digital picture signals are inputted to the respective shift registers, the inputted digital picture signals are sequentially shifted in the respective shift registers in synchronization with a clock signal until they are outputted to the corresponding storage circuits, and the shifted digital picture signals are taken into the storage circuits by a latch signal while a supply of the clock signal to the respective shift registers is being stopped, is repeated  $n$  ( $n$  is an integer not less than 2) times in a time corresponding to one horizontal scan period.

Lewis teaches an operation in which the digital picture signals are inputted to the respective shift registers (Fig. 15A, items Digital data in, 505), the inputted digital picture signals are sequentially shifted in the respective shift registers in synchronization with a clock signal until they are outputted to the corresponding storage circuits (Fig. 15A, item 515), and the shifted digital picture signals are taken into the storage circuits by a latch signal while a supply of the clock signal to the respective shift registers is being stopped (See Fig. 15B, items SR Clock, LATCH), is repeated  $n$  ( $n$  is an integer not less than 2) (See Fig. 15B, items SELECT 1, SELECT 2,...) times in a time corresponding to one horizontal scan period (See Figs. 15A-15B, items SR CLOCK, LATCH, Col. 10, Lines 22-48).

It would have been obvious to one of ordinary skill in the art at the time of invention to incorporate teachings of Lewis into Shinya system in order to fabricate from polysilicon (See Col. 4, Lines 41-45 in the Lewis reference).

As to claim 80, Shinya teaches a signal driver circuit of an image display device (See Col. 1, Lines 6-10) for driving the plurality of signal lines (See Fig. 1, item 6, Col. 1, Lines 31-32), the signal line driver circuit comprising:

an integral multiple of 8 shift registers (in reference inside of each item 13 are 8 shift registers (DFFs in Figure 1 of the application) connected in series, with 8 outputs to DAC) to which  $m$ -bit ( $m$  is natural number) (in reference 8) digital picture signals are inputted (See first example and Fig. 2, item 13, Col. 4, Lines 1-12),

a plurality of D/A converter circuits for converting output signals of the storage circuits into analog signals (Fig. 2, item 15, Col. 4, Lines 1-7), and

a plurality of signal line selecting circuits for transmitting output signals of the D/A converter circuits to the corresponding signal lines (see Fig. 2, items P1-Pn, Col. 4, Lines 16-23),

The first example of Shinya does not disclose a plurality of storage circuits for storing output signals of the shift registers by a latch signal.

The third example of Shinya teaches a plurality of storage circuits for storing output signals of the shift registers by a latch signal (See Fig. 10, item 21, Col. 7, Lines 3-18).

It would have been obvious to one of ordinary skill in the art at the time of invention to implement different elements of the source driver as shown by different examples of Shinya because of small driver circuit size requirements (See Col. 1, Lines 16-18 in the Shinya reference).

Shinya does not disclose an operation in which the digital picture signals are inputted to the respective shift registers, the inputted digital picture signals are sequentially shifted in the respective shift registers in synchronization with a clock signal until they are outputted to the corresponding storage circuits, and the shifted digital picture signals are taken into the storage circuits by a latch signal while a supply of the clock signal to the respective shift registers is being stopped, is repeated  $n$  ( $n$  is an integer not less than 2) times in a time corresponding to one horizontal scan period.

Lewis teaches an operation in which the digital picture signals are inputted to the respective shift registers (Fig. 15A, items Digital data in, 505), the inputted digital picture signals are sequentially shifted in the respective shift registers in synchronization with a

Art Unit: 2629

clock signal until they are outputted to the corresponding storage circuits (Fig. 15A, item 515), and the shifted digital picture signals are taken into the storage circuits by a latch signal while a supply of the clock signal to the respective shift registers is being stopped (See Fig. 15B, items SR Clock, LATCH), is repeated  $n$  ( $n$  is an integer not less than 2) (See Fig. 15B, items SELECT 1, SELECT 2,...) times in a time corresponding to one horizontal scan period (See Figs. 15A-15B, items SR CLOCK, LATCH, Col. 10, Lines 22-48).

It would have been obvious to one of ordinary skill in the art at the time of invention to incorporate teachings of Lewis into Shinya system in order to fabricate from polysilicon (See Col. 4, Lines 41-45 in the Lewis reference).

As to claim 105, Shinya teaches an image display device (See Col. 1, Lines 6-10), comprising:

- a pixel array portion including a  $k$  of signal lines (See Fig. 1, item 2), a plurality of scan lines (See Fig. 1, item 3), a plurality of pixel electrodes provided at respective regions where the respective signal lines and the respective scan lines intersect with each other (See Fig. 1, item 4), and plurality of switching elements for driving the plurality of pixel electrodes (See Fig. 1, item 5, Col. 1, Lines 21-30);

- a signal line driver circuit for driving the  $k$  of signal lines (See Fig. 1, item 6, Col. 1, Lines 31-32); and

- a scan line driver circuit for driving the plurality of scan lines (See Fig. 1, item 7, Col. 1, Lines 32-39),

wherein signal line driver includes an integral multiple of 8 shift registers (in reference inside of each item 13 are 8 shift registers (DFFs in Figure 1 of the application) connected in series, with 8 outputs to DAC) to which m-bit (m is natural number) (in reference 8) digital picture signals are inputted (See first example and Fig. 2, item 13, Col. 4, Lines 1-12),

a plurality of D/A converter circuits for converting output signals of the storage circuits into analog signals (Fig. 2, item 15, Col. 4, Lines 1-7), and a k/n (in reference N/M) of signal line selecting circuits for transmitting output signals of the D/A converter circuits to the corresponding signal lines (See Fig. 2, items P1-Pn, Col. 4, Lines 16-23

The first example of Shinya does not disclose a  $m \times k/n$  of storage circuits for storing output signals of the shift registers by a latch signal.

The third example of Shinya teaches a plurality of storage circuits (equal to the number of the DAC) for storing output signals of the shift registers by a latch signal (See Fig. 10, item 21, Col. 7, Lines 3-18).

It would have been obvious to one of ordinary skill in the art at the time of invention to implement different elements of the source driver as shown by different examples of Shinya because of small driver circuit size requirements (See Col. 1, Lines 16-18 in the Shinya reference).

Shinya does not disclose an operation in which the digital picture signals are inputted to the respective shift registers, the inputted digital picture signals are sequentially shifted in the respective shift registers in synchronization with a clock signal

until they are outputted to the corresponding storage circuits, and the shifted digital picture signals are taken into the storage circuits by a latch signal while a supply of the clock signal to the respective shift registers is being stopped, is repeated  $n$  ( $n$  is an integer not less than 2) times in a time corresponding to one horizontal scan period.

Lewis teaches an operation in which the digital picture signals are inputted to the respective shift registers (Fig. 15A, items Digital data in, 505), the inputted digital picture signals are sequentially shifted in the respective shift registers in synchronization with a clock signal until they are outputted to the corresponding storage circuits (Fig. 15A, item 515), and the shifted digital picture signals are taken into the storage circuits by a latch signal while a supply of the clock signal to the respective shift registers is being stopped (See Fig. 15B, items SR Clock, LATCH), is repeated  $n$  ( $n$  is an integer not less than 2) (See Fig. 15B, items SELECT 1, SELECT 2,...) times in a time corresponding to one horizontal scan period (See Figs. 15A-15B, items SR CLOCK, LATCH, Col. 10, Lines 22-48).

It would have been obvious to one of ordinary skill in the art at the time of invention to incorporate teachings of Lewis into Shinya system in order to fabricate from polysilicon (See Col. 4, Lines 41-45 in the Lewis reference).

As to claim 115, Shinya teaches a signal driver circuit of an image display device (See Col. 1, Lines 6-10) for driving the  $k$  of signal lines (See Fig. 1, item 6, Col. 1, Lines 31-32, the signal line driver circuit comprising:

shift registers to which  $m$ -bit ( $m$  is a natural number) (in reference 8) digital picture signals are inputted, the number of the shift registers being an integral multiple

of  $m$  (in reference inside of each item 13 are 8 shift registers (DFFs in Figure 1 of the application) connected in series, with 8 outputs to DAC) (See first example and Fig. 2, item 13, Col. 4, Lines 1-12),

a plurality of D/A converter circuits for converting output signals of the storage circuits into analog signals (Fig. 2, item 15, Col. 4, Lines 1-7), and

a  $k/n$  (in reference N/M) of signal line selecting circuits for transmitting output signals of the D/A converter circuits to the corresponding signal lines (See Fig. 2, items P1-Pn, Col. 4, Lines 16-23)

The first example of Shinya does not disclose a  $m \times k/n$  of storage circuits for storing output signals of the shift registers by a latch signal.

The third example of Shinya teaches a plurality of storage circuits (equal to the number of the DAC) for storing output signals of the shift registers by a latch signal (See Fig. 10, item 21, Col. 7, Lines 3-18).

It would have been obvious to one of ordinary skill in the art at the time of invention to implement different elements of the source driver as shown by different examples of Shinya because of small driver circuit size requirements (See Col. 1, Lines 16-18 in the Shinya reference).

Shinya does not disclose an operation in which the digital picture signals are inputted to the respective shift registers, the inputted digital picture signals are sequentially shifted in the respective shift registers in synchronization with a clock signal until they are outputted to the corresponding storage circuits, and the shifted digital picture signals are taken into the storage circuits by a latch signal while a supply of the

clock signal to the respective shift registers is being stopped, is repeated  $n$  ( $n$  is an integer not less than 2) times in a time corresponding to one horizontal scan period.

Lewis teaches an operation in which the digital picture signals are inputted to the respective shift registers (Fig. 15A, items Digital data in, 505), the inputted digital picture signals are sequentially shifted in the respective shift registers in synchronization with a clock signal until they are outputted to the corresponding storage circuits (Fig. 15A, item 515), and the shifted digital picture signals are taken into the storage circuits by a latch signal while a supply of the clock signal to the respective shift registers is being stopped (See Fig. 15B, items SR Clock, LATCH), is repeated  $n$  ( $n$  is an integer not less than 2) (See Fig. 15B, items SELECT 1, SELECT 2,...) times in a time corresponding to one horizontal scan period (See Figs. 15A-15B, items SR CLOCK, LATCH, Col. 10, Lines 22-48).

It would have been obvious to one of ordinary skill in the art at the time of invention to incorporate teachings of Lewis into Shinya system in order to fabricate from polysilicon (See Col. 4, Lines 41-45 in the Lewis reference).

As to claim 25, 112, Shinya teaches a display is carried out using a liquid crystal material (see Col. 1, Lines 12-19).

As to claim 106, 116, Shinya teaches the number of converter circuits is  $4(k/8 \times 2)$  (See Fig. 2, item 15, Col. 5, Lines 38-48).

Art Unit: 2629

2. Claims 20-24, 81-85, 107-111 and 117-121 are rejected under 35 U.S.C. 103(a) as being unpatentable over Shinya and Lewis as applied to claims 19, 80, 105 and 115 above, and further in view of Luder et al. (US Patent No. 5,642, 117).

As to claim 20, 81, 107 and 117, Shinya and Lewis do not disclose a ramp type D/A converter with bit comparison pulse width converter circuit and analog switch.

Luder et al. teaches a ramp type D/A converter with bit comparison pulse width converter circuit and analog switch (See Fig. 1, items a0-a3, b0-b3, 10-13, Sr, C, in description See from Col. 5, to Col. 6, Line 8).

It would have been obvious to one of ordinary skill in the art at the time of invention to use a bit comparison pulse width converter circuit and analog switch as shown by Luder et al. in Shinya and Lewis system in order to optimize digital/analog conversion so that as little circuitry expense as possible is required (See Col. 2, Lines 16-19 in the Luder et al. reference).

As to claim 21-24, 82-85, 108-111 and 118-121, Shinya and Lewis do not disclose the storage circuit is a latch circuit with analog switch, holding capacitance with clocked inverter and a plurality of inverters.

Luder et al. teaches the storage circuit is a latch circuit with analog switch, holding capacitance with clocked inverter and a plurality of inverters (See Figs. 14A-14B, items Q1-Q2, nQ1-Nq2, 400, 420, 430, Col. 9, Lines 51-67 and Col. 10, Lines 1-21).

It would have been obvious to one of ordinary skill in the art at the time of invention to incorporate teaching of Luder et al. into Shinya and Lewis system in order to reduce cost (See Col. 2, Lines 16-19 in the Luder et al. reference).

3. Claims 26, 113 are rejected under 35 U.S.C. 103(a) as being unpatentable over Shinya and Lewis as applied to claims 19, 105 above, and further in view of Friend et al. (US Patent No. 5,247, 190).

Shinya and Lewis do not disclose a display is carried out using an electroluminescence material.

Friend et al. teaches a display is carried out using an electroluminescence material (See Fig. 3, items 3-5, Col. 8, Lines 5-20).

It would have been obvious to one of ordinary skill in the art at the time of invention to use materials as shown by Friend et al. in Shinya and Lewis system in order to increase the range of applications.

4. Claims 27, 114 are rejected under 35 U.S.C. 103(a) as being unpatentable over Shinya and Lewis as aforementioned in claims 19, 105 in view of Matsueda et al (US Patent No. 6,384,806 B1).

Shinya and Lewis do not teach a portable telephone, which uses the image display device.

Matsueda et al. shows a portable telephone, which uses the image display device (See Fig. 19-22, in description See Col. 23, Lines 10-15).

It would have been obvious to one of ordinary skill in the art at the time of invention to use the Shinya and Lewis apparatus in the portable telephone as shown by Matsueda et al. in order to increase the range of applications.

5. Claims 86-87, 122-123 are rejected under 35 U.S.C. 103(a) as being unpatentable over Shinya and Lewis as aforementioned in claims 81, 115 in view of Lewis (US Patent No. 5,589,847).

Shinya and Lewis do not teach the driver circuit is formed of a poly silicon thin film transistor or of a single crystal transistor.

Lewis teaches the driver circuit is formed of a poly silicon thin film transistor or of a single crystal transistor (See Abstract).

It would have been obvious to one of ordinary skill in the art at the time of invention to incorporate teaching of Lewis into the Shinya and Lewis system in order to increase the mobility of transistors.

### ***Response to Arguments***

6. Applicant's arguments with respect to claims 19-27, 80-87, 105-123 have been considered but are moot in view of the new ground(s) of rejection.

### ***Telephone Inquire***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Leonid Shapiro whose telephone number is 571-272-7683. The examiner can normally be reached on 8 a.m. to 5 p.m..

Art Unit: 2629

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Richard Hjerpe can be reached on 571-272-7691. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
